Style Sense: Generative AI-Powered Fashion Recommendation System

Abstract: Style Sense is a Generative AI-powered fashion recommendation system designed to provide personalized, intelligent, and interactive fashion styling experiences. The system uses Generative Artificial Intelligence, Large Language Models, and multimodal AI models to recommend outfits based on user preferences, body type, skin tone, occasion, weather, season, and fashion trends. It integrates an AI Fashion Assistant that provides real-time styling advice, a Virtual Wardrobe for managing personal clothing collections, and a Smart Shopping module for recommending suitable fashion products.The system also includes AI-based image generation and Virtual Try-On features that allow users to visualize recommended outfits before making purchasing decisions. Developed using Django and MySQL, the platform provides secure user authentication, personalized profiles, administrative controls, analytics, and recommendation management. By combining conversational AI, personalization, and visual technologies, StyleSense reduces the time required for outfit selection, improves styling confidence, and supports more informed fashion decisions. The proposed system contributes to Sustainable Development Goal (SDG) 12 – Responsible Consumption and Production by helping users make more informed purchasing decisions and encouraging better utilization of existing wardrobe items through digital wardrobe management. It also supports SDG 9 – Industry, Innovation and Infrastructure through the application of Generative AI and intelligent digital technologies in the fashion industry.

Keywords: Generative AI, Fashion Recommendation System, Personalized Fashion, Artificial Intelligence, Large Language Models, Virtual Try-On, Virtual Wardrobe, AI Image Generation

Supervisor Approval

I hereby approve the above abstract for Major Project development.
